

Python Tools & Utilities Report

This report summarizes the purpose and functionality of the Python scripts (.py) found within the `eleventy/site/` directory and its subfolders. Many of these tools are designed for site maintenance, content processing, or testing systems.

Core Site Utilities

1. `generate_urls_permaLinks.py`

- **Purpose:** Automates the generation of a list of all blog post URLs.
- **How it works:** Recursively scans the project for Markdown (.md) files, excluding system folders like `_site` and `node_modules`. It converts file paths into Eleventy-style permalinks (e.g., `folder/file.md` -> `/folder/file/`).
- **Output:** Generates `post_urls.txt`.

2. generate_urls-cvs.py

- **Purpose:** Creates a dataset for testing the comment system.
- **How it works:** Similar to the permalink generator, but instead of a simple list, it creates a CSV file populated with placeholder data (Name: "Tim", Rating: 6).
- **Output:** Generates test_data.csv.

3. submit_fake_comments.py

- **Purpose:** Stress-tests or populates the Google Forms-based comment system.
- **How it works:** Reads the test_data.csv file, uses the Faker library to generate realistic names, and submits comments programmatically to a Google Form using HTTP requests.
- **Configuration:** Uses a hardcoded Google Form ID and entry fields.

4. merge_posts.py

- **Purpose:** Consolidates all website content into a single searchable or readable file.
- **How it works:** Aggregates the content of every .md file in the project. It extracts the title from the YAML front matter and adds a clear header for each source file.

File Name

Des
Ma
dire

Report generated on: 2026-04-19

- **Output:** Generates timestamped files like `merged_content_2025-10-04_15-38-16.txt`.
- **Use Case:** Extremely useful for providing a “full site knowledge base” to AI models or for global search indexing.

5.migrate_images.py

- **Purpose:** Complete migration of site assets from PNG to WebP format.
 - **How it works:**
 1. **Batch Conversion:** Scans the entire project for directories named `assets/` and converts all `.png` files to `.webp`. It uses premium settings: `quality: 40`, `compression_level: 6`, and `preset: drawing`.
 2. **Auto-Cleanup:** Automatically deletes the original `.png` file once a successful `.webp` conversion is confirmed.
 3. **Reference Updating:** Scans all Markdown files (front matter and body) for image references and updates them to point to the new `.webp` extension.
 - **Use Case:** This tool is used to significantly reduce site weight and improve performance by transitioning to modern image formats.
-

Game-Specific Tools

games/slopped04/update_pdf.py &
games/slopped05/update_pdf.py

- **Purpose:** A specialized pipeline for converting PDF “zines” into web-optimized image galleries.

Workflow:

1. Extracts pages from a specified PDF using PyMuPDF (fitz).
2. Uses ftfpdf to convert those pages into **WebP** format.
3. Applies premium compression settings: quality: 40, compression_level: 6, and preset: drawing for maximum readability at minimum file size.

4. **Crucially:** It then automatically overwrites the index.html file in the same directory to update the gallery with the new image count and language support.

games/maumau/images/cards/
list_files.py

- **Purpose:** Simple inventory tool.
- **How it works:** Lists every file in the card images directory and writes it to a reference file.
- **Output:** Generates file_list.txt.

games/maumau/images/cards/files.py

- **Status:** Currently an empty file. Likely a placeholder for future logic (e.g., mapping card IDs to file names).

Summary of Generated Files

(.txt / .csv)

File Name Source Script

post_urls.txt generate_urls_permaLinks.py

test_data.csv generate_urls-cvs.py

merged_content_...txt merge_posts.py

file_list.txt list_files.py
