

dependency-tree-esm Returns an unordered array of local paths to dependencies of a Node ES module JavaScript file. See also: dependency-tree for the CommonJS version. This is used by Eleventy to find dependencies of a JavaScript file to watch for changes to re-run Eleventy's build. 1	Installation npm install --save-dev @11ty/dependency-tree-esm Features - Ignores bare specifiers (e.g. import "my-package") - Ignores Node's built-ins (e.g. import "path") - Handles circular dependencies 2	Returns an empty set if the file does not exist. Usage // my-file.js // if my-local-dependency.js has dependencies, it will include those too import "./my-local-dependency.js"; 3	// ignored, is a built-in import path from "path"; const { find } = require("@11ty/dependency-tree-esm"); await find("./my-file.js"); // returns ["./my-local-dependency.js"] 4
