

@11ty/recursive-copy A temporary fork of timkendrick/recursive-copy to satisfy https://github.com/11ty/eleventy/issues/3299 as Eleventy slowly moves to use Node native API fs.cp. - v4.x requires Node 18+ - v3.x requires Node 0.10+ - v2.x requires Node 0.10+	Simple, flexible file copy utility Features - Recursively copy whole directory hierarchies - Choose which files are copied by passing a filter function, regular expression or glob - Rename files dynamically, including changing the output path - Transform file contents using streams - Choose whether to overwrite existing files - Choose whether to copy system files	- Filters out junk files by default - Emits start, finish and error events for each file that is processed - Optional promise-based interface Examples Node-style callback interface <pre>var copy = require('@11ty/recursive-copy');</pre>	<pre>copy('src', 'dest', function(error, results) { if (error) { console.error('Copy failed: ' + error); } else { console.info('Copied ' + results.length + ' files'); } });</pre>
