

Dependency Graph Changelog 1.0.0 (Dec 5, 2023) - Switched to use Map/Set rather than using raw objects as pseudo-Maps/Sets. (Fixes #46) - This is also the reason for the major version bump. While there are no functional changes, this library previously did not have any 1	special requirements of the runtime. It now requires a runtime that supports Map/Set (which should be almost everything now in 2023). - Ensure circular property is cloned during clone - thanks andrew-healey and tintinthong! 0.11.0 (March 5, 2021) - Add entryNodes method that returns the nodes that nothing depends on - thanks amcdn! 2	0.10.0 (January 9, 2021) - Add directDependenciesOf and directDependantsOf methods for retrieving direct dependency information. (Fixes #40) - Add aliases dependentsOf and directDependentsOf. 3	0.9.0 (February 10, 2020) - Rewrite the topological sort DFS to be more efficient (and work!) on large graphs. - No longer uses recursion to avoid stack overflows with large/deep graphs - No longer is accidentally $O(N^2)$ (thanks willtennien for pointing this out!) 4
0.5.2 (October 22, 2017) - Add missing parameter in TypeScript definition. (Fixes #19) 0.5.1 (October 7, 2017) - Now exposes TypeScript type definition - thanks vangorra! 0.5.0 (April 26, 2016) - Add optional data parameter for the addNode method. (Fixes #12) 8	0.7.0 (January 17, 2018) - Allow circular dependencies by passing in {circular: true} into the constructor - thanks tbranzen! 0.6.0 (October 22, 2017) - Add a size method that will return the number of nodes in the graph. - Add a clone method that will clone the graph. Any custom node data will only be shallow-copied. (Fixes #14) 7	0.7.2 (August 30, 2018) - Make constructor parameter optional in TypeScript definition. (Fixes #26) 0.7.1 (June 5, 2018) - Fix TypeScript definition to include the new constructor arguments added in 0.7.0 - thanks tbranzen! 9	0.8.1 (December 3, 2019) - Ensure all nodes are included in overallOrder when cycles are allowed. (Fixes #33) 0.8.0 (December 11, 2018) - Add a DepGraphCyclicError with cyclePath property - thanks jhugman! 5
- Add methods getNodeData and setNodeData to manipulate the data associated with a node name. (Fixes #12) - Change the hasNode method to be able to cope with falsy node data. (Fixes #12) 0.4.1 (Sept 3, 2015) - Check all nodes for potential cycles when calculating overall order. (Fixes #8) 9	0.4.0 (Aug 1, 2015) - Better error messages - When a cycle is detected, the error message will now include the cycle in it. E.g Dependency Cycle Found: a -> b -> c -> a (Fixes #7) - When calling addDependency if one of the nodes does not exist, the error will say which one it was (instead of saying that "one" of the two nodes did not exist and making you manually determine which one) 10	- Calling overallOrder on an empty graph will no longer throw an error about a dependency cycle. It will return an empty array. 0.3.0 (July 24, 2015) - Fix issue where if you call addNode twice with the same name, it would clear all edges for that node. Now it will do nothing if a node with the specified name already exists. (Fixes #3) 11	0.2.1 (July 3, 2015) - Fixed removeNode leaving references in outgoingEdges and reference to non-existent var edges - thanks juhoha! (Fixes #2) 0.2.0 (May 1, 2015) - Removed dependency on Underscore - thanks myndzi! (Fixes #1) 12
