

node-errno Better libuv/Node.js/io.js error handling & reporting. Available in npm as <i>errno</i>. 1	Build Status 2	errno exposed Custom errors ## errno exposed Ever find yourself needing more details about Node.js errors? Me too, so <i>node-errno</i> contains the errno mappings direct from libuv so you can use them in your code. By errno: <pre>require('errno').errno[3] // → { // "errno": 3, // "code": "EACCES",</pre> 3	<pre>// "description": "permission // denied" // }</pre> By code: <pre>require('errno').code.ENOTEMPTY // → { // "errno": 53, // "code": "ENOTEMPTY", // "description": "directory not // empty" // }</pre> 4
8 Supply no arguments for the full list. Error codes are processed case-insensitive. No such errno/code: "foo" <pre>~ \$ errno foo { "description": "read-only file "code": "ERDFS", "errno": 56, } ~ \$ errno EROFS</pre>	7 Use as a command line tool: <pre>fs.readFile('thisisnotarealfile.txt', function (err, data) { if (err) console.log(errmsg(err)) }) ~ \$ errno 53 {"errno": 53, "code": "ENOTEMPTY", "description": "directory not empty"}</pre>	6 <pre>// if it's a 'fs' error then it'll have a 'path' property if (err.path) str += ' [' + err.path + ']' return str } var fs = require('fs')</pre>	5 Make your errors more descriptive: <pre>var errno = require('errno') function errmsg(err) { var str = 'Error: ' // if it's a libuv error then get the description from errno if (errno.errno[err.errno]) str += errno.errno[err.errno].description else str += err.message }</pre>
You will need to install with <code>npm install errno -g</code> if you want the <code>errno</code> command to be available without supplying a full path to the <code>node_modules</code> installation. ## Custom errors Use <code>errno.custom.createError()</code> to create custom <code>Error</code> objects to throw around in your Node.js library. Create error hierarchies so <code>instanceof</code> becomes a useful tool in tracking errors. Call-stack is correctly captured at the time you create an instance of the error object, plus a <code>cause</code> property will 9	make available the original error object if you pass one in to the constructor. <pre>var create = require('errno').custom.createError var MyError = create('MyError') // inherits from Error var SpecificError = create('SpecificError', MyError) // inherits from MyError var OtherError = create('OtherError', MyError)</pre> 10	// use them! <pre>if (condition) throw new SpecificError('Eeek! Something bad happened') if (err) return callback(new OtherError(err))</pre> Also available is a <code>errno.custom.FileSystemError</code> with in-built access to <code>errno</code> properties: 11	<pre>fs.readFile('foo', function (err, data) { if (err) return callback(new errno.custom.FileSystemError(err)) // do something else })</pre> The resulting error object passed through the callback will have the following properties: <code>code</code>, <code>errno</code>, <code>path</code> and <code>message</code> will contain a descriptive human-readable message. 12
