

pr r r Build Status An sensible alternative to Object.defineProperty(). Available in npm and Ender as pr. Usage Set the property 'foo' (obj.foo) to have the value 'bar' with default options 1	('enumerable', 'configurable' and 'writable' are all false): pr(obj, 'foo', 'bar') Adjust the default options: pr(obj, 'foo', 'bar', { enumerable: true, writable: true }) Do the same operation for multiple properties: 2	pr(obj, { one: 'one', two: 'two' }) // or with options: pr(obj, { one: 'one', two: 'two' }, { enumerable: true, writable: true }) Simplify! But obviously, having to write out the full options object makes it nearly as bad as the original Object.defineProperty() so we can simplify. 3	As an alternative method we can use an options string where each character represents a option: 'e'=='enumerable', 'c'=='configurable' and 'w'=='writable': pr(obj, 'foo', 'bar', 'ew') // enumerable and writable but not configurable // multiple properties: pr(obj, { one: 'one', two: 'two' }, 'ewc') // configurable too 4

Licence	Anywhere! For pre-ES5 environments <i>pr</i> = value so you can get close to what you want. <i>pr</i> is Ender-compatible so you can include it in your Ender build and \$.pr(...) or var pr = require('pr'); pr(...). Where can I use it?
